

For checkpoint 1, I have a fully setup project file using the Meta SDK toolkit, probuilder, and a few material/asset packs. I have the basic environment setup with the camera rig, and locations for my sticky notes and calendar. I did some temporary environment setup, but I will be changing the scene as I continue working through this project. My project file is also quite large due to some of the add-ons I imported. I will be majorly cutting the size for the next checkpoint as I figure out what assets I want to keep using. While I haven't implemented any logic yet for my main features, I have been busy figuring out how to actually implement these features. I've been watching Unity tutorials and reading how to make custom components in Unity as well. These have been a tremendous help in my understanding of Unity and by checkpoint 2, I should have these features mostly or fully implemented. Overall, my actual project is still quite minimal, but my understanding and plan for how to complete my project is done. By checkpoint 2, I will have a lot of new additions and changes.
